

Minitab Connect® October Release

Features in Minitab Connect® October Release

Connect now enables users to add and manage comments directly on supported control chart data points in Dashboard Monitoring View.

Use control chart annotations to capture context where process changes occur, review the latest comment from the chart, and keep operational knowledge connected to the underlying data point. Monitoring View also keeps dashboard filters and slicers from changing the monitored chart, providing a consistent view for ongoing process review.

Enhancements to Dashboards

You can now use multiple columns to define the x-axis in interactive control charts and to define preset selections for categorical and numeric slicers. You can also use a new Refresh Data button to refresh data across all dashboard pages on demand without enabling automatic updates.

Bug Resolution in Minitab Connect® October Release

- Resolved an issue in which the Google Drive connector could not move files added by another account to the Historic folder.
- Resolved an issue in which uploading a file larger than 1 GB provided no error message or job-status entry.
- Resolved an issue in which the final Oracle connector setup step could be blank instead of indicating whether a Data Gateway connection succeeded or failed.
