Minitab Connect® 7.10.5

Table of Contents

1. New Features in Minitab Connect 7.10.5

Connection-Specific Variables

This feature enables users to set variables at the "Connection" level. Users can utilize these variables across all the RestAPI requests downstream, making it easy to switch between versioning or dynamic time-based filtering. These variables also make it easier for us to control and manage the volume of data returned to each subscription table.

Endpoints with Multiple Pages of Responses

This feature allows an endpoint to return a subset of the total amount of records from a table or entity, split across multiple API requests. The response also includes a specific "key" whose value is a link to view the "next page" of records. This makes requesting bigger volumes of data more efficient for the 3rd party resources and also allows our system to parse and import smaller batches at a time.

2. Problems Resolved in Minitab Connect 7.10.5

The following issues are resolved in Connect 7.10.5:
- Deleting a field associated with a Multi-Field Index (MFI) breaks the MFI configuration. (290343)
- Alarms are deleted when the creator's role is downgraded to a lower-privileged user. (289404)
