

Real-Time SPC™ 7.10.9

1. New Features in Real-Time SPC 7.10.9

Descriptor Marker for Control Charts

Provides the ability to visually indicate descriptor changes on control charts. Tracking the changes in lot number, shifts, or other user-defined descriptors helps identify process variation due to these changes and improve overall product traceability.

2. Maintenance Items in Real-Time SPC 7.10.9

Consolidate Notifications

Improves the notification experience by reducing the total number of emails and texts. Notifications are now consolidated by type across all subgroups and measures. For text alerts, messages are summarized to stay within character limits.

3. Problems Resolved in Real-Time SPC 7.10.9

The following issues are resolved in Real-Time SPC 7.10.9

- After rerunning an automated component setup, some sampling plans had mixed collection methods. (301625)
- Duplicated descriptors in collection forms after rerunning an automated component setup. (301627)
- Components created by one team member are not visible to others in the Manage Station portal, even when appropriate permissions are in place. This may affect collaboration and consistency across teams. (296813)
