

Real-Time SPC™ September 2026

Release Date: September 2026

New Features in Real-Time SPC, September 2026

Visual Prompt for Out-of-Specification Values

You can now choose whether operators see a visual prompt when out-of-specification values are detected during manual data collection. You can also set how long the prompt remains visible before the collection details dialog opens.

Station Dashboard Exception Indicators

The Station Dashboard now includes Out-of-Specification (OOS) and Out-of-Control (OOC) indicators, making it easier to identify the most recent measure exceptions. Select an indicator to go directly to the affected measure's control chart or data view.

Operator Dashboard Filtering

You can now select a product and process once to filter all matching stations in the Operator Dashboard. This helps operators save time by quickly focusing on the relevant stations and sampling plans without repeating the same selection for each station.
